

## DEEP WELL APPLICATION

Our system of valves will only work with wells that are 4" or wider in diameter.

Valves should not be installed more than 25 feet below water level. Your pump should deliver at least 7 gallons per minute at valve level.

For pumps that deliver only 7 gallons-per-minute the tension on the spring in the Two-Way Diverter Valve should be reduced by moving the pin up one notch.

Note that this adjustment should only be made in deep well applications or in situations where gravity pressure in the supply lines is very low.

Heat cables are not required when our system is installed for use with a deep well.
